An Introduction to Soil Science Dr. Robert L. Ficklin (Spring 2008) The Purposes and Functions of Soils Soils are natural bodies made from both mineral and organic materials and capable of supporting plants out-of-doors. Soils have horizons, roughly parallel to the earth's surface, that indicate the degree to which materials have been altered and redistributed by water,

too will slowly weather, form soil materials, erode away, and eventually form rock again, as the cycle continues. Weathering Soil formation starts with weathering, which happens to bare rock as well as to buried rock. Several factors bring about weathering: 1. Temperature fluctuation, which causes expansion and contraction. 2. Erosion by water, wind, and ice.

In soil mechanics the elastostatic solutions for a line load or a distributed load on a half plane are of great importance because they provide basic solutions for the stress distribution in soils due to loads on the surface. In chapters 11 and 12 the solution for two corresponding

Introduction to Soil Testing. Introduction to Soils: To design a good sampling plan for soil and water testing, one needs to consider the basic facts related to soil formation and water cycling. For both soil and water, we are dealing with complex systems, where biological, chemical and physical factors all interact. Also, soil and water are interconnected, and farming practices affect both ...
