

handbook of heterogeneous catalysis pdf

1.. Introduction One of the most fundamental concepts in heterogeneous catalysis is the volcano curve. It has been established empirically that a volcano-shaped curve is obtained when the activity of catalysts for a certain reaction is plotted as a function of a parameter relating to the ability of the catalyst surface to form chemical bonds to reactants, reaction intermediates, or products, .

The Brønsted–Evans–Polanyi relation and the volcano curve

Hydrogenation is a chemical reaction between molecular hydrogen (H₂) and another compound or element, usually in the presence of a catalyst such as nickel, palladium or platinum. The process is commonly employed to reduce or saturate organic compounds. Hydrogenation typically constitutes the addition of pairs of hydrogen atoms to a molecule, often an alkene.

Hydrogenation - Wikipedia

A Ziegler–Natta catalyst, named after Karl Ziegler and Giulio Natta, is a catalyst used in the synthesis of polymers of 1-alkenes (alpha-olefins). Two broad classes of Ziegler–Natta catalysts are employed, distinguished by their solubility: Heterogeneous supported catalysts based on titanium compounds are used in polymerization reactions in combination with cocatalysts, organoaluminum ...

Berzelius erkannte 1835 in den obigen Reaktionen die Gemeinsamkeit, dass neben den Edukten und Produkten immer ein weiterer Stoff in der Reaktion notwendig war, der offenbar nicht verbraucht wurde. Er prägte dazu den Begriff Katalyse in Analogie zu Analyse: „Ich werde sie die katalytische Kraft der Körper, und die Zersetzung durch dieselbe Katalyse nennen.“

O nióbio é um elemento químico, de símbolo Nb, número atômico 41 (41 prótons e 41 elétrons) e massa atômica 92,9 u. É um elemento de transição pertencente ao grupo 5 ou 5B da classificação periódica dos elementos. O nome deriva da deusa grega Níobe, filha de Dione e Tântalo – este último, por sua vez deu nome a outro elemento da família 5B, o tántalo.
