Epigenetic drug discovery has now witnessed the emergence of a new target class of proteins, the bromodomains. In their Communication on page 827 ff., D. J. Dixon, P. E. Brennan et al. report the first potent, selective, cell-permeable, and cell-active chemical probe for the p300/CBP associated factor (PCAF) bromodomain. A combination of computational docking studies, inhibitor design, and ...

Built to perform: A facile, one-step hydrothermal method is used to synthesize a 3D, symmetric, flowerlike Sb<sub>2</sub>S<sub>3</sub> nanostructure (see figure) for application as a photoelectric material. The structure is composed of numerous nanoneedles, which provided a large void fraction and specific surface area, and has better electrocatalytic activity and charge-transfer ability than that of platinum.

Amanita muscaria, commonly known as the fly agaric or fly amanita, is a basidiomycete mushroom, one of many in the genus Amanita. It is also a muscimol mushroom. Native throughout the temperate and boreal regions of the Northern Hemisphere, Amanita muscaria has been unintentionally introduced to many countries in the Southern Hemisphere, generally as a symbiont with pine and birch plantations ...

A typical soil is about 50% solids (45% mineral and 5% organic matter), and 50% voids (or pores) of which half is occupied by water and half by gas. The percent soil mineral and organic content can be treated as a constant (in the short term), while the percent soil water and gas content is considered highly variable whereby a rise in one is simultaneously balanced by a reduction in the other.
